

Case Study: GM

Qrimp is the easiest way to import, export, collaborate on, and share your information with the world!

Shedding Legacy Systems

When Linda Puzey, IT Contract Manager for General Motors, proposed migrating their legacy Global Manufacturing Peer Review System (GMPRS) to a web application, the project was denied due to the estimated \$2 million price tag.

So she built it herself with Qrimp!

Qrimp chosen for its strengths

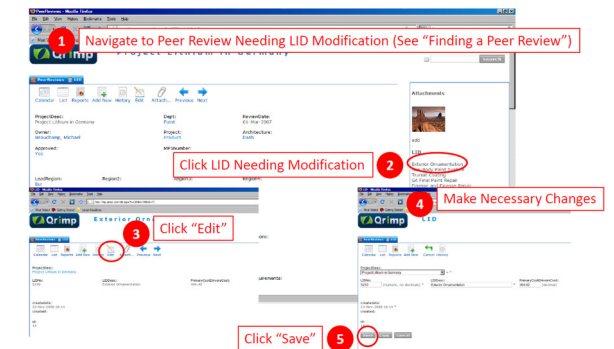

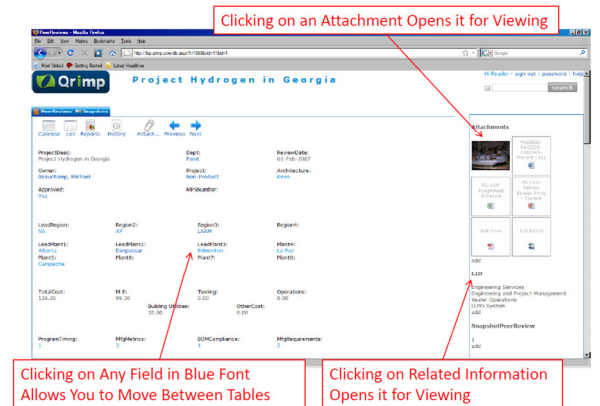

“Overall, Qrimp is a very nice tool to work in. The Graphical User Interface is intuitive, the webcast training modules are very well done, and any questions beyond that are handled promptly and professionally by their Support Techs. The ability to deploy behind the corporate firewall and to work offline & replicate back are the primary reasons we chose to use Qrimp for the project.”

Custom Security

“In addition, there is **very sophisticated built-in security**. By using a combination of user groups, column level security and group level security, specific menus, tables and columns can be provided to specific users. It is possible to limit access to specific rows of data based on the value of a given field...”
